

Executive Summary

AI Readiness Assessment · Example Corp · July 2026

KEY FINDING

The organization is ready to scale: strategy and technology score well above the industry benchmark. Data quality (48) and governance (41) are the limiting factors — both fall below the critical threshold of 50 and put the ROI of the planned use cases at risk.

TOP USE CASES BY PRIORITY

	Use case	Value	Feasibility	Rating
01	Proposal drafting with RAG	86	78	QUICK WIN
02	Predictive maintenance line 3	81	55	STRATEGIC
03	Support copilot 1st level	62	82	QUICK WIN

EU AI ACT STATUS

12 use cases classified · 1 gap analysis open (Art. 6, Annex III)

NEXT 90 DAYS

- 01 Establish the data governance board
- 02 Launch the proposal-drafting quick-win pilot
- 03 Complete the EU AI Act gap assessment

READINESS ASSESSMENT

AI Readiness

Six dimensions · Self-assessment, 42 criteria

DIMENSION · SCORE · BENCHMARK · DEV.

| Benchmark mark ± deviation vs. industry

PRIORITIZED ACTION AREAS

- GOVERNANCE · 41**

No AI decision body, no model policies. Establish a board with a clear mandate and define RACI for model approvals — a precondition for scaling.
- DATA · 48**

Master data quality inconsistent, no central catalog. Assign data ownership per domain; quality gates before every production use case.
- ORGANIZATION · 55**

AI skills concentrated in two teams. Launch an enablement program and a tandem model (business + data) for the three prioritized use cases.

METHODOLOGY

SURVEY	SCALE	CADENCE
42 criteria · self-assessment plus 6 expert interviews	0–100 per dimension Benchmark: industry, n = 214	Re-assessed every six months next survey Jan 2027

USE-CASE-PORTFOLIO

Use-Case Portfolio

Twelve use cases · Value × Feasibility

PORTFOLIO LOGIC

Three prioritized use cases absorb 80% of the available delivery capacity next quarter.
The defer quadrant is re-evaluated every six months — feasibility rises with data maturity.

BUSINESS VALUE

- Revenue potential
- Cost reduction
- Risk mitigation

FEASIBILITY

- Data maturity
- Technical complexity
- Change effort

DISTRIBUTION

Quick Wins	5
Strategic	3
Selective	3
Defer	1

COMPLIANCE STATUS

EU AI Act Compliance

Risk classification · Twelve use cases · As of July 2026

0

PROHIBITED

Art. 5 – Unacceptable risk
No use cases affected.

1

HIGH-RISK

Art. 6, Annex III
HR screening: conformity assessment & registration required.

4

LIMITED

Art. 50 – Transparency obligations
Labeling required for four customer-facing assistants.

7

MINIMAL

No specific obligations
Internal tools — voluntary code of conduct recommended.

REGULATORY DEADLINES

OPEN OBLIGATIONS

OPEN	Conformity assessment HR screening (Art. 43) — target date Sep 30, 2026
IN PROGRESS	Technical documentation per Annex IV — 60% complete
DONE	Transparency labeling of all four assistants (Art. 50)

DOCUMENTATION STATUS — HIGH-RISK SYSTEM

Technical documentation (Annex IV)		60 %
Risk management system (Art. 9)		45 %
Logging & record-keeping (Art. 12)		80 %
Human oversight (Art. 14)		70 %

Roadmap

Three horizons · July 2026 to December 2027

GOVERNING PRINCIPLE

No use case goes to production without a governance approval and data quality gate. Each horizon ends with a review and re-assessment.

MATURITY PROJECTION

REVIEW CADENCE

FILLED = REVIEW MILESTONE

Architecture

Executive summary · Target architecture: SAP-centric MLOps stack

AI ASSESSMENT

GENERATED

EXECUTIVE

The target architecture implements a scalable governance and MLOps framework built on SAP AI Core, Kubernetes and Apache Airflow to accelerate AI pilots across the enterprise. The business value lies in operationalizing data models, reducing time-to-value for ML applications and creating reusable knowledge through central orchestration. The most critical risk: insufficient data governance and compliance enforcement without strong MDG and Vault integration.

INVESTMENT Y1

240–640 k€

Licenses · Integration · Enablement

RUN COST

19–56 k€

per month

DELIVERY

6–12

Months

RISK PROFILE

review — DPA pending

KEY DECISIONS

AI-ASSISTED

- 01 Kubernetes as the primary container orchestration — secrets centralized in HashiCorp Vault.
- 02 Connect SAP AI Core via BTP Auth & Trust with SAP MDG; MLflow as the experiment registry.
- 03 Apache Airflow as the master orchestrator of ML pipelines; Kafka as the event backbone.
- 04 Grafana and OpenMetadata for observability and data lineage — compliance audit trail.
- 05 MLOps automation as the next investment stage — CI/CD and feature store established.
- 06 Data quality is the architecture blocker — prioritize the data platform before ML infra.
- 07 Align architecture decisions with the roadmap of Jun 24, 2026 — rollout in three phases.

NEXT STEPS

- 01 Pilot (4 weeks): one use case with AI Launchpad, Kubernetes and Airflow in non-production.
- 02 Governance gate: validate MDG data quality, Vault audit logs and OpenMetadata lineage.
- 03 Build the MLOps team — ML engineer, MLOps engineer, AI CoE lead; standardize DAG patterns.
- 04 Integrate SAP Analytics Cloud and Datasphere with HANA Cloud for AI impact metrics.
- 05 Link roadmap milestones to architecture components — synchronize phase 1 activities.
- 06 Set up the SAP BTP account, activate AI Core, create the first deployment workspace.
- 07 Close DPAs with all third-party providers with conditional GDPR compliance.
